

Unboxing The Raspberry Pi

Srisivan.k

I had been yearning for the Raspberry Pi since my father said he would buy me one. But he set forth a challenge that I had to finish. The challenge was this: I had to write a simple, but eligible program about the working of a remote, based on the observations and researching how remotes work.

I worked hard for one week, writing the program, researching about it and taking help from others. Finally I reached a program, that would be enough. My father accepted. Here's the program that I wrote :

```
answer = input('Welcome. Please enter on for executing the program, and Ctrl  
+C for terminating it. '')
```

```
if (answer == "on"):  
    for i in range(0, 100):  
        user_input = input()  
        var channel = 0  
        if (user_input == i):  
            channel = user_input  
            if (user_input == "channel +"):  
                channel += 1  
            if (user_input == "channel -"):  
                channel -= 1
```
